

# T-Series Power System Installation

# Installing Power Strip

## 1 STEP ONE

Slide the power strip behind existing shelving and lower until just above base deck. Ensure the top and bottom labels are correct.

## 2 STEP TWO

For fixtures with peg hole backing, use two plastic rivets to secure the power strip through holes found in each cap.

## 3 STEP THREE

For solid panel backing, use the two black wood screws provided.

# Connecting Power Adapter

## 1 STEP ONE

Remove the base deck below the power strip closest to the power source.

## 2 STEP TWO

Plug the AC cord into the T-Series extension, then plug the T connector into the power adapter.

## 2 STEP THREE

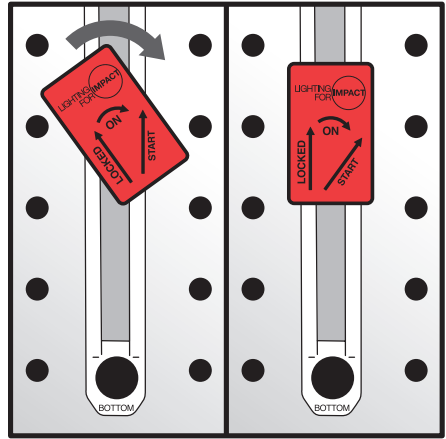

Next, plug the other end of the AC cord into the power source. The power source may be on the outside of the gondola or a receptacle underneath the gondola. An LED indicator on the power adapter should now come on.

# Powering the Power Strips

## 1 STEP ONE

To snap the red Power Input Connector (PIC) onto the power strip, first align the START arrow vertically with the power strip (as shown) and press the connector into the strip track. Ensure that your connector is fully inserted and flush against power strip — then rotate clockwise. When it snaps into place leaving the LOCKED arrow aligned with the power strip, the connection is complete.

## 2 STEP TWO

Place the adapter near the power strip under the base deck of the gondola. Use magnetic tray to attach to underside of base deck lid.

## 3 STEP THREE

Take the end of the red DC extension and plug it into the PIC.

# Powering the Power Strips (continued)

4

## STEP FOUR

Run the T-Series extension under the base deck of the gondolas toward the next power strip. Plug the cord into the input of another power adapter. The green LED light should come on. Place near the power strip under the base deck.

**Repeat steps at each power strip.**

**NOTE: ONLY 10 adapters can be used in sequence.**

# Install LED Lighting (Magnetic)

## 1 STEP ONE

Ensure the cord is on the same side as the power strip. Magnetize the LED to the underside of shelf and slide the strip toward the front edge.

## 2 STEP TWO

Use the magnetic clips to secure the spiral wire. Two clips are provided per shelf. These will help keep the wire up and away from the product.

# Install LED Lighting (Wire)

## 1 STEP ONE

Position LED with the cord on same side as power strip, place LED on top of the shelf with LEDs pointing down. Slide the strip toward the front edge of the shelf. Snap the plastic “U” clips over the LED and onto the shelf wire to secure the LED. Install one clip per foot of LED.

## 2 STEP TWO

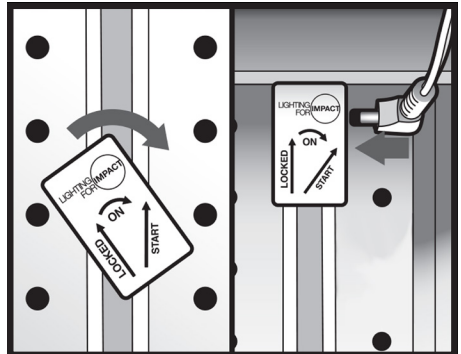

Use the plastic “S” clips to secure the spiral cord. Two clips are provided per shelf. The small portion of the “S” clip snaps around the wire shelf, while the large portion is used to retain the spiral cord. These will help keep the wire up and away from the product.

## 3 STEP THREE

Align the START arrow with the power strip. Gently push the connector into the power strip and rotate clockwise until it snaps into place leaving the LOCKED arrow aligned with the power strip.

Once installed, insert the barrel plug on the LED cord into the output connector.
